

## Casting

We cast parts as model in bronze, aluminum and cast iron. Manage from mold development to the finished casting.

### **BRONZE CASTING HANDBOOK, ALUMINIUM AND IRON**

Use of earth molding is desirable in cases in which required a fine finish, it allows obtaining pieces of all dimensions in series or in units.

Due to the type of casting, you can get variety of models.

Works are made with a different type of alloy, as the piece has to suffer: wear, friction, high temperature. Etc.

### **MOLDING IN FOR BRASS AND ALUMINIUM shell**

This is a method of casting of aluminum gravity.

All kinds of parts are made, special parts, machining, tooling, etc..

One of the advantages of this process is the highest strength achieved through rapid solidification, which produces a structured piece with finer grain.

Generally, you can also get parts to keep its dimensions, as well as a better finish.
